Quick Reference Guide

Semaglutide (GLP-1)

Compounded Semaglutide

MICRODOSE | GLP-1 | INJECTION

At a microdose level, semaglutide works through its systemic effects — reducing neuroinflammation, supporting metabolic resilience, and helping the body function with less internal resistance. A fixed, sustained protocol.

Compounded Semaglutide

FULL DOSE | GLP-1 | INJECTION

Semaglutide activates the body's own appetite-regulating signals — steadying blood sugar, quieting food noise, and creating the metabolic conditions for sustainable weight management. Prescribed and dosed to your individual profile.

Ozempic®

FULL DOSE | GLP-1 | INJECTION

Semaglutide activates the body's own appetite-regulating signals — steadying blood sugar, quieting food noise, and creating the metabolic conditions for sustainable weight management. Prescribed and dosed to your individual profile.

Wegovy®

FULL DOSE | GLP-1 | INJECTION

Semaglutide activates the body's own appetite-regulating signals — steadying blood sugar, quieting food noise, and creating the metabolic conditions for sustainable weight management. Prescribed and dosed to your individual profile.

*Compounded peptide therapies are available only by prescription through a licensed provider and prepared by licensed pharmacies. Exact compounded ingredients may vary by state. These compounded versions are not FDA-approved. All medical guidance comes from healthcare professionals, not Xyngular or its distributors.

XMD WELLNESS

Tirzepatide (GLP-1/GIP)

Compounded Tirzepatide

MICRODOSE | GLP-1/GIP | INJECTABLE

At a microdose level, tirzepatide acts on two key metabolic pathways—GIP and GLP-1—helping regulate appetite and blood sugar. A fixed, sustained protocol designed to support metabolic health without a traditional weight-loss dosing approach.

Compounded Tirzepatide

FULL DOSE | GLP-1/GIP | INJECTABLE

Tirzepatide activates two metabolic pathways simultaneously — GIP and GLP-1 — enhancing insulin sensitivity, stabilizing glucose, and delivering a more comprehensive level of satiety and metabolic support.

Zepbound®

FULL DOSE | GLP-1/GIP | INJECTION PEN

Tirzepatide activates two metabolic pathways simultaneously — GIP and GLP-1 — enhancing insulin sensitivity, stabilizing glucose, and delivering a more comprehensive level of satiety and metabolic support.

*Compounded peptide therapies are available only by prescription through a licensed provider and prepared by licensed pharmacies. Exact compounded ingredients may vary by state. These compounded versions are not FDA-approved. All medical guidance comes from healthcare professionals, not Xyngular or its distributors.

XMD WELLNESS

Longevity Solutions

Sermorelin

INJECTABLE

Sermorelin signals the pituitary gland to support the body's natural growth hormone production — the hormone responsible for tissue renewal, muscle and bone maintenance, metabolic function, and nightly recovery. It works with your body's own systems, not against them.

NAD+

INJECTABLE

NAD+ is required for nearly every energy-producing reaction in the body — fueling mitochondria, supporting cellular renewal, and helping the body adapt to metabolic and environmental stress. Levels decline naturally with age, making replenishment increasingly important over time.

NAD+

NASAL SPRAY

NAD+ is required for nearly every energy-producing reaction in the body — fueling mitochondria, supporting cellular renewal, and helping the body adapt to metabolic and environmental stress. Levels decline naturally with age, making replenishment increasingly important over time.

Glutathione

INJECTABLE

Glutathione is one of the body's most critical antioxidants — protecting cells from oxidative stress, supporting detoxification pathways, and helping maintain the cellular environment needed for healthy aging. Stress, poor sleep, and environmental exposure all deplete it over time.
